Univariate: daily return distribution by company

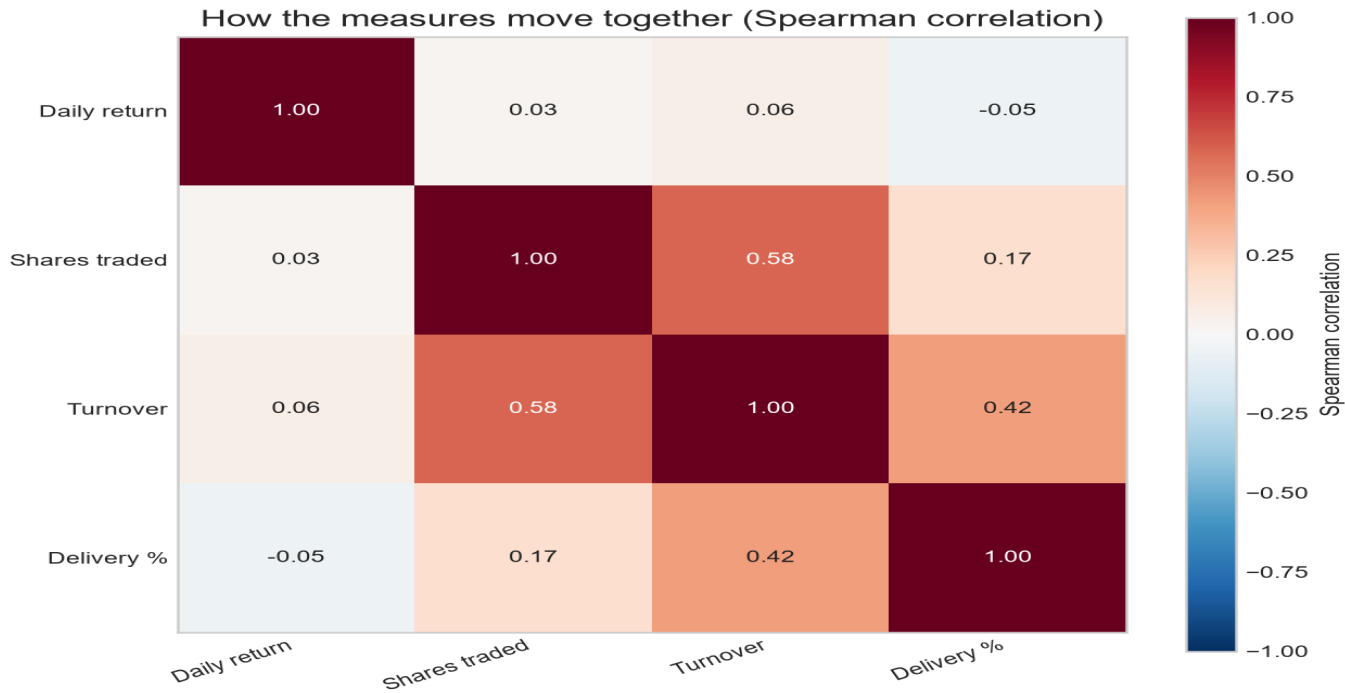

Shares traded and turnover

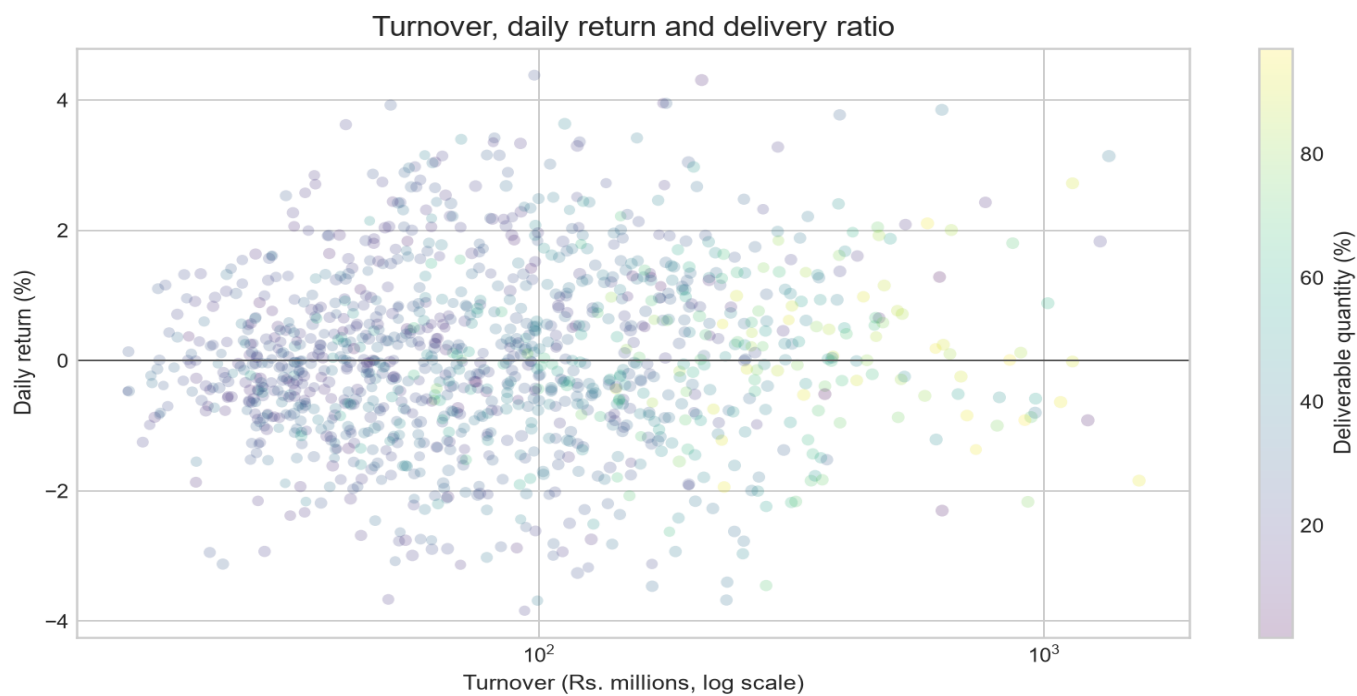

Bivariate: delivery ratio vs daily return

How the measures move together (Spearman correlation)

Notes

All figures are descriptive summaries of the provided CSV data. Period return is calculated as $(\text{last close} / \text{first close} - 1) \times 100$ using chronologically sorted observations. Average turnover and delivery use available non-null values. This report is for project analysis and is not investment advice.
